HDOC Day-60

Question: Write a C program to read two lowercase strings and pass their addresses to check_anagram() using pointers. Print "Anagram" if both strings contain the same characters with the same frequencies, otherwise print "Not Anagram". Use character-frequency counting.

C Program:

```
#include <stdio.h>
#include <string.h>

void check_anagram(char *s, char *t) {
    int freq[26] = {0};
    int i;

    if (strlen(s) != strlen(t)) {
        printf("Not Anagram\n");
        return;
    }

    for (i = 0; s[i] != '\0'; i++) {
        freq[s[i] - 'a']++;
        freq[t[i] - 'a']--;
    }

    for (i = 0; i < 26; i++) {
        if (freq[i] != 0) {
            printf("Not Anagram\n");
            return;
        }
    }
    printf("Anagram\n");
}

int main(void) {
    char s[1000], t[1000];
    scanf("%999s %999s", s, t);
    check_anagram(s, t);
    return 0;
}
```

Sample Input 1: listen silent

Output: Anagram

Sample Input 2: hello world

Output: Not Anagram

Explanation: The program first checks the string lengths. It then counts each letter in the first string and subtracts the counts for the second string. If all 26 counts are zero, the strings are anagrams.
