

HDOC - Day 5: Complete Answer

Question: Multiply two numbers without using the * operator.

Completed Algorithm

1. Start.
2. Define **num1**, **num2**, **prod**, **index** as integers.
3. Input **num1** and **num2**.
4. Set **prod = 0** and **index = 1**.
5. Repeat while **index <= num2**:
 - 5.1 Set **prod = prod + num1**.
 - 5.2 Set **index = index + 1**.
6. Print **prod**.
7. Stop.

Corrected Flowchart

If YES: prod = prod + num1 -> index = index + 1 -> go back to "Is index <= num2?"

If NO: Print prod -> Stop.

Important correction in the given flowchart: The decision condition should be **index <= num2**, not **index <= num1**. The loop repeats num2 times, adding num1 each time.

Example: If num1 = 4 and num2 = 3, prod = 4 + 4 + 4 = **12**.
